

WHAT IS CHIRAL CORRECTION?

Chiral correction is a process by which ingredients are purified to their most natural state making them more recognised by the body and thus function more effectively at the cellular level

They are more active and less irritating. This means more antioxidant protection, more cellular renewal and more collagen promotion to mention a few of the benefits.

Skin, the body's largest organ, has millions of chiral receptors that dictate instruction to the cells they are attached to. This process is extremely precise.

A skin care ingredient attracting to a skin cell receptor can be compared to a hand-in-glove or lock-in-key relationship. For example, a left hand can't fit into a right glove successfully. A key will not work if it doesn't have the right shape for a specific lock.

When skin care ingredients reach skin receptors with the wrong spin for the receptor site, the message can be blocked, incomplete, or inaccurate resulting in irritation and inflammation of the skin.

Chemical Peels that have been chirally corrected are less painful, less traumatic, extremely safe for all skin types and very effective. They provide both superficial and medium depth peeling with virtually no risk of hyperpigmentation or other unwanted side effects. You'll also see a more cosmetically acceptable, layered exfoliation instead of the typical brown necrotic debris that occurs with many other peels.

The reason chirally correct ingredients are not more prevalent in many of today's products is that they are much more expensive and the products are more difficult to make.

Our skin care products are not just chirally correct, they are all plant based without artificial colours, preservatives, or fragrances.

Our skin care products give the origins of all their ingredients and take pride in having the highest percentage of active ingredients and are free from fillers.
